Summary

The **ADM-VPX3-7V2** is a high performance reconfigurable 3U OpenVPX format board based on the Xilinx Virtex-7 range of Platform FPGAs.

Features include PCI Express Gen2 interface, external memory, high density I/O using a Vita 57 standard, high Pin Count FMC interface, Gigabit Ethernet Interface, system monitoring and flash boot facilities.

A comprehensive cross platform API with support for **Microsoft Windows**, **Linux** and **VxWorks** provides access to the full functionality of these hardware features.
Placing the PCI Express bridge in bypass allows the creation of a Gen 2 x8 PCI Express endpoint design directly into the target FPGA (Target FPGAs VX330T and VX690T can also support Gen3 x8 PCI Express designs).

The **ADM-VPX3-7V2** is available in a cost reduced form without a separate Bridge FPGA for high-volume production orders. A Rear Transition Module (RTM) is available to accelerate development by providing monitor and control access to all Rear (backplane) IO signals.
